Exam Proctoring Audit Log System

Project Name:

- Exam Proctoring Audit Log *System*

Current Problem:

- Difficulty in tracking and monitoring exam violations effectively.
- Lack of a centralized and secure system to record proctoring events and audit logs.
- Challenges in verifying student identity and detecting suspicious activities in real time.
- Risk of data tampering or loss of exam records and audit trails.

Description about project:

- The system is designed to record, monitor, and manage all exam proctoring events and audit logs efficiently. It enables administrators and proctors to track student activities during exams, detect unauthorized behavior, and review flagged incidents with precise timestamps. The system automatically categorizes audit logs, generates risk scores, and secures event data against unauthorized modifications. This ensures full integrity, transparency, and accountability throughout the online assessment process.

- System Request — Exam Proctoring Audit Log System

Section	Details
Project Sponsor:	khaled
Business Need:	1. Reduce exam fraud and unauthorized activities. 2. Transition from manual proctoring to an automated audit log system. 3. Ensure continuous monitoring and accessibility for authorized personnel. 4. Maintain high exam integrity and data reliability.
Business Requirements:	1. Implement continuous log tracking and real-time alerts. 2. Provide secure online access for proctors and admins. 3. Establish a dedicated IT and database infrastructure. 4. Generate audit reports and analytical dashboards.
Business Value:	1. Providing accurate, tamper-proof audit trails. 2. Saving time during post-exam review and dispute resolution. 3. Reducing operational costs associated with manual monitoring. 4. Streamlining administrative efforts.
Special Issues or Constraints:	1. Strict submission deadline (e.g., 1 January). 2. Requirement for continuous synchronization and system updates.

Feasibility Analysis

Technical Feasibility

1. We need to design the user interface using HTML, CSS, and JavaScript (or modern web frameworks like React/Vue).
2. Development tools and IDEs like Visual Studio / VS Code are required for implementation.
3. The system must operate online with seamless web/cloud connectivity.
4. The system needs to be cross-platform, supporting major operating systems like Windows, Android, and macOS/iOS.

Economic Feasibility

1. The overall business and academic benefits of the project outweigh the implementation costs.
2. Primary operational costs will stem from infrastructure maintenance, cloud hosting, and security services.
3. Access rights and licensing can be structured based on user roles and institutional subscriptions.
4. Development costs remain manageable by leveraging open-source technologies and scalable cloud services.

Organizational Feasibility

Organizational Feasibility Analysis includes the assessment of:

1. **Management prowess:** Evaluating the technical capability and readiness of the initial project management team.
2. **Resource sufficiency:** Assessing the required non-financial resources, including human resources (management, developers, proctors), facility/location setup, hardware equipment, and intellectual property protection.
