Interview & Requirements Gathering Report

1. Introduction

- This report summarizes the data and system requirements collected through stakeholder interviews for the **Exam Proctoring Audit Log System**. The interview method serves as a primary tool for gathering critical information regarding user perspectives, current system operations, and future objectives.

2. Interview Information Analysis

- **Interviewee Opinions:**
  - Stakeholders believe that automated audit logging is essential for maintaining academic integrity during remote examinations, but it should be paired with human oversight to avoid false accusations.
  - Opinions highlight that tracking window shifts and tab-switching provides a reliable deterrent against unauthorized external assistance.
- **Interviewee Feelings:**
  - Instructors and proctors expressed initial anxiety regarding system reliability and potential software crashes during critical exam hours.
  - Students often experience apprehension regarding digital privacy, requiring transparent communication about what specific activities the audit system monitors.
- **Current State of the System:**
  - The current architecture relies on relational database structures to securely map student sessions and record immutable event logs with precise timestamps.
  - Existing monitoring features allow administrators to track basic browser blur events and user disconnects, though manual filtering of warning logs is still required.
- **System Goals:**
  - To establish a secure, unalterable audit trail that guarantees complete fairness and compliance with institutional data policies.

- To automate the detection and reporting of suspicious student behaviors, reducing the workload on human proctors while generating reliable compliance logs.

3. Conclusion

- The insights gathered from the interviews regarding user opinions, emotional concerns, current technical constraints, and primary goals ensure that the development of the Exam Proctoring Audit Log System will effectively address both security and usability requirements.
