question1) How do you plan to design the database schema to efficiently store ?continuous audit log entries during a large-scale online exam

إجابتك

question2) What architectural patterns would you recommend to ensure that real-?time log notifications do not overload the server

إجابتك

question3) Does the system architecture utilize WebSockets to push live audit ?logs to the proctor's dashboard

- yes
- no

question4) Are all sensitive user passwords and audit logs encrypted before being saved into the primary database?

- yes
- no

question5) Should the audit log system store logs locally on the client's browser first, or should it stream every event directly to the server immediately?

- store locally first as a backup
- stream directly to the server immediately

question6) Do you prefer using a relational database like MySQL or a non-relational database like MongoDB for managing the audit trail records?

- relational database
- non-relational database

question7) You mentioned that the system tracks tab-switching events; exactly how does the client-side JavaScript detect when a user minimizes the browser window?

إجابتك

question8) Can you elaborate on how the system handles database deadlocks when hundreds of students trigger simultaneous violation logs at the exact same second?

إجابتك

question9) What strategies will you implement to ensure that the audit log reports exported for institutional review are completely tamper-evident?

إجابتك

question10) Regarding the user authentication layer, how does the system ensure that a proctor's session token cannot be hijacked by an unauthorized user?

إجابتك
